

Scotland 2050

The thing I would like to see is

... NPF4 to actively support the de-carbonisation of the fuel cycle through a targeted Scottish Government/UK Government Collaborative programme of green zero carbon fuel production sites aligned with the strategic and regional transport network – for example, 200+ha Chapelcross Green Energy and Enterprise Park on the M6/A74(M) and TEN-T Core Network (Europe)

I would like to see this because ...

. 2045 net zero target will not be delivered without appropriate intervention from Governments. The current level of intervention to develop and drive plans is neither effective nor efficient.

Addressed to those who can best make this happen:

Delivery needs to be through be collaborative, with multiples stakeholders with single point overall accountability.

Scotland 2050

The thing I would like to see is....

NPF4 to target the identification of Green Energy production, storage, transmission and distribution sites that best support the Just Transition {for example, Chapelcross Green Energy and Enterprise Park proposal and Borderlands ambitions}

I would like to see this because ...

The Just Transition risk needs to be managed. Someone needs to lead and its won't be local authorities. They generally do not have the competence or capacity to develop or deliver this task.

Addressed to those who can best make this happen:

If Scotland is to have a plan to deliver the 2045 target, then the accountability lies with Government.
